Calcium signalling remodelling and disease Biochemical

A wide range of Ca²⁺ signalling systems deliver the spatial and temporal Ca²⁺ signals necessary to control the specific functions of different cell types. Release of Ca²⁺ by Ins P 3 (inositol 1,4,5-trisphosphate) plays a central role in many of these signalling systems. Ongoing transcriptional processes maintain the integrity and stability of

Calcium Signaling and Neurodegeneration

Neuronal Ca²⁺ Signaling. Calcium signaling in neurons connects membrane excitability with the biological function of the cell. Since Ca²⁺ channels are located on the boundary between the electrical and the signaling worlds, they play a key role in various aspects of the neuronal function.

Calcium signaling Wikipedia

Calcium (Ca²⁺) ions are important for cellular signalling, as once they enter the cytosol of the cytoplasm they exert allosteric regulatory effects on many enzymes and proteins. Calcium can act in signal transduction resulting from activation of ion channels or as a second messenger caused by indirect signal transduction pathways such as G protein-coupled receptors.
