Cyclic Compound an overview ScienceDirect Topics

Cyclic compounds that have one or more atoms other than carbon within the ring are called heterocyclic compounds. Those that have $4n + 2$ electrons are heterocyclic aromatic compounds . Nitrogen and oxygen are the most commonly encountered heteroatoms in naturally occurring heterocyclic compounds.

Alicyclic compound Wikipedia

An alicyclic compound is an organic compound that is both aliphatic and cyclic. They contain one or more all-carbon rings which may be either saturated or unsaturated, but do not have aromatic character. Alicyclic compounds may have one or more aliphatic side chains attached.

The term "aryl" also includes polycyclic ring systems having two or more cyclic rings in which two or more carbons are common to two adjoining rings (the rings are "fused rings") wherein at least one of the rings is aromatic, e.g., the other cyclic rings may be cycloalkyls, cycloalkenyls, cycloalkynyls, aryls and/or heterocyclyls.

Cyclic compound Article about cyclic compound by The

cyclic compound, any one of a class of compounds whose molecules contain a number of atoms bonded together to form a closed chain or ring. If all of the atoms that form the ring are carbon, the compound is said to be carbocyclic; if not, the compound is called heterocyclic.

And when you're numbering your bicyclic compounds, you want to start at the bridgehead carbon, then number along the longest path, then the second longest path, and then finally the shortest path. So let's go ahead and do that. Let's start with the top bridgehead carbon. We'll make that number 1. And we're going to number along the longest path, so the longest path would be going left. So that
