In mathematics, the Courant-Friedrichs-Lewy (CFL) condition is a necessary condition for convergence while solving certain partial differential equations (usually hyperbolic PDEs) numerically by the method of finite differences. It arises in the numerical analysis of explicit time integration schemes, when these are used for the numerical solution. As a consequence, the time step must be

1. The Courant-Friedrichs-Lewy Condition The Visual Room

The Courant-Friedrichs-Lewy Condition The CFL condition ($\sigma \leq 1$) ensures that the domain of dependence of the governing equation is entirely contained in the domain of dependence of the numerical scheme. Can extend this to more complex cases where deriving the stability condition is more difficult for more complex numerical schemes. Also demonstrates why backward differencing is

Second, is the following an application of the Courant-Friedrichs-Lewy condition?: In molecular dynamics, the computer tracks the position of atoms as they move over time. If two atoms are moving towards each other on a collision course, if the time step were too large, they would pass through each other.

There exists also an English translation of the 1928 German original: see references Courant, Friedrichs & Lewy 1956 and Courant, Friedrichs & Lewy 1967, 3. This situation commonly occurs when a hyperbolic partial differential operator has been approximated by a finite difference equation, which is then solved by numerical linear algebra methods. 4. This quantity is not necessarily the same.

Stability of Finite Difference Methods

Stability of Finite Difference Methods In this lecture, we analyze the stability of finite difference discretizations. First, we will discuss the Courant-Friedrichs-Lewy (CFL) condition for stability of finite difference methods for hyperbolic equations. Then we will analyze stability more generally using a matrix approach. 51 Self-Assessment Before reading this chapter, you may wish to
