[Repetitive Transcranial Magnetic Stimulation \(rTMS\) | CAMH](#)

Transcranial Magnetic Stimulation (TMS) involves a series of short magnetic pulses directed to the brain to stimulate nerve cells.

[Transcranial magnetic stimulation - Mayo Clinic](#)

Repetitive transcranial magnetic stimulation (rTMS) is a noninvasive form of brain stimulation used for depression. Unlike vagus nerve stimulation or deep brain stimulation, rTMS does not require surgery or implantation of electrodes. And, unlike electroconvulsive therapy (ECT), rTMS doesn't cause seizures or require sedation with anesthesia.

[Transcranial magnetic stimulation - Wikipedia](#)

Transcranial magnetic stimulation (TMS) is a form of neurostimulation. TMS is a non-invasive procedure in which a changing magnetic field is used to cause electric current to flow in a small targeted region of the brain via electromagnetic induction. During a TMS procedure, a magnetic field generator, or "coil", is placed on the scalp.:
